PROPOSED SOLUTIONS

- For $f : \mathbb{R}^n \rightarrow \mathbb{R}$, $\mathbf{b} \in \mathbb{R}^n$, the degree- k Taylor polynomial of f at \mathbf{b} is $P_{\mathbf{b},k}^f(\mathbf{h})$. The Lagrange remainder $R_{\mathbf{b},k}^f(\mathbf{h}) = f(\mathbf{b} + \mathbf{h}) - P_{\mathbf{b},k}^f(\mathbf{h})$ is given by $\sum_{|\alpha|=k+1} \partial^\alpha f(\mathbf{b} + c\mathbf{h}) \frac{\mathbf{h}^\alpha}{\alpha!}$, for some $c \in (0, 1)$. Recall $|R_{\mathbf{b},k}^f(\mathbf{h})| \leq M \|\mathbf{h}\|^{k+1}/(k+1)!$ where M is an upper bound for all partials of f of order $k+1$.
- A function $g : \mathbb{R}^n \rightarrow \mathbb{R}$ is called *harmonic* if for every $\mathbf{x} \in \mathbb{R}^n$ its Laplacian is zero, that is, $\Delta g(\mathbf{x}) = (\partial_{11}g + \partial_{22}g + \dots + \partial_{nn}g)(\mathbf{x}) = 0$.
- I wish you keep on having fun with maths in 2025.

1. Suppose for a C^2 function $f : \mathbb{R}^3 \rightarrow \mathbb{R}$, $f(\mathbf{x}) \rightarrow \infty$ as $|\mathbf{x}| \rightarrow \infty$. Prove that there is a point $\mathbf{b} \in \mathbb{R}^3$ such that $\partial_{11}f(\mathbf{b}) + \partial_{22}f(\mathbf{b}) + \partial_{33}f(\mathbf{b}) \geq 0$.

By thm, there is an absolute min $\mathbf{a} \in \mathbb{R}^3$ of f . Since \mathbf{a} is a local min, $\nabla f(\mathbf{a}) = 0$ and $Jf(\mathbf{a}) \geq 0$ and $\text{trace } Hf(\mathbf{a}) \geq 0$.

But this last inequality is exactly what's asked with $\mathbf{b} = \mathbf{a}$.

2. Consider the function $f(x, y, z, w) = (z^3 + xw - y, w^3 + yz - x)$ and its zero level set $S_0 = \{f = 0\} \in \mathbb{R}^4$.

(a) Determine the set of all points $(a, b, c, d) \in S_0$ near which, on S_0 , (y, w) can be written as a function of (x, z) . Write down all relations which a, b, c, d must satisfy.

(b) Suppose on S_0 , $(y, w) = \varphi(x, z)$ around the point $(1, 1, 0, 1) \in S_0$. Compute $\partial_z \varphi(1, 0)$.

(a) An application of ImpFT... Note f is C^1 (polynomial).

Consider $\begin{pmatrix} \partial_y f_1 & \partial_w f_1 \\ \partial_y f_2 & \partial_w f_2 \end{pmatrix} = \begin{pmatrix} -1 & w \\ z & 3w^2 \end{pmatrix}$. Its det at (a, b, c, d) is $-3d^2 - cd$.

By ImpFT, (y, w) is a fnc of (x, z) on S_0 whenever

det $\neq 0$ on S_0 : $d(3d+c) \neq 0$ & $c^3 + ad = b$, $d^3 + bc = a$

(b) Let $P = (1, 1, 0, 1)$. Suppose $(y, w) = \varphi(x, z) = (\varphi_1(x, z), \varphi_2(x, z))$ around P on S_0 . We're asked $\partial_z \varphi = (\partial_z \varphi_1, \partial_z \varphi_2) = (\partial_z y, \partial_z w)$ at P .

On S_0 , $0 = \partial_z f_1 = 3z^2 + x \cdot w_z - y_z \quad \Big| \quad = w_z - y_z \quad \longrightarrow \quad y_z(1, 0) = -1/3$

$0 = \partial_z f_2 = 3w^2 \cdot w_z + y \cdot z + y \quad \Big| \quad = 3w_z + 1 = w_z(1, 0) = -1/3$
at P Hence $\partial_z \varphi(P) = (-1/3, -1/3)$

3. (a) Find $P_{0,5}^f(x,y)$ for the function $f(x,y) = x \sin(x+y)$.

(b) Give an upper bound for $|R_{0,5}^f(1,1)|$.

(a) Observe $P_{0,k}^f(x,y) = x \cdot P_{0,k-1}^{\sin u}(x+y)$. So $P_{0,0}^f(x,y) = 0 = P_{0,1}^f(x,y)$.
 $P_{0,2}^f = x \cdot (x+y) = P_{0,3}^f$; $P_{0,4}^f = x \left[x+y - \frac{(x+y)^3}{3!} \right] = P_{0,5}^f$

(b) By thm, $|R_{0,5}^f(1,1)| \leq M \cdot \frac{(1+1)^6}{6!}$. For all index pair $\alpha = (\alpha_1, \alpha_2)$ with $|\alpha| = \alpha_1 + \alpha_2 = 6$, the partial $\partial^\alpha f(x,y)$ is a sum of sines, cosines, x sines, x cosines. There are at most 7 such terms in $\partial^\alpha f$. So $|\partial^\alpha f(1,1)| \leq 7$.
Hence $|R_{0,5}^f(1,1)| \leq 7 \cdot \frac{2^6}{6!} = \frac{28}{45}$. Of course, much better can be done. Do it in your leisure.

4. (a) Find the degree-3 Taylor polynomial of $\tan u$ at 0.

(b) Find the degree-3 Taylor polynomial of $\ln(1+u)$ at 0.

(c) Using (a) and (b), evaluate the limit $\lim_{x \rightarrow +\infty} \frac{\tan^2 \frac{1}{x}}{\ln^2(1 + \frac{4}{x})}$.

(a) $\tan u = u + \frac{u^3}{3}$ (differentiating three times)

(b) $P_{0,k}(u)$ for $\frac{1}{1+u}$ is $\sum_{n=0}^k (-1)^n u^n$

So $P_{0,k+1}(u)$ for $\ln(1+u)$ is $\sum_{n=0}^k (-1)^n \cdot \frac{u^{n+1}}{n+1} = u - \frac{u^2}{2} + \frac{u^3}{3} - \dots + (-1)^k \frac{u^{k+1}}{k+1}$

(c) $\lim_{x \rightarrow +\infty} \frac{\tan^2 \frac{1}{x}}{\ln^2(1 + \frac{4}{x})} = \lim_{u \rightarrow 0^+} \left(\frac{\tan u}{\ln(1+4u)} \right)^2 = \lim_{u \rightarrow 0^+} \left(\frac{u - \frac{u^2}{2} + R_{0,2}^{\tan}(u)}{4u + R_{0,2}^{\ln}(u)} \right)^2 = \lim_{u \rightarrow 0^+} \left(\frac{1 - \frac{u}{2} + \frac{R_{0,2}^{\tan}}{u}}{4 + \frac{R_{0,2}^{\ln}}{u}} \right)^2 = \frac{1}{16}$

5. Say True or False. Then prove or disprove... Solve on the spaces provided in this page.

(a) Let $f: \mathbb{R}^n \rightarrow \mathbb{R}^n$ be of class C^1 and $\det Df(0) \neq 0$. Then there is a neighborhood of $0 \in \mathbb{R}^n$ in which f is one-to-one.

TRUE
By InvFT, f has a (C^1) inverse around 0.
Hence around 0, f is 1-1.

(b) Suppose that $g: I \rightarrow \mathbb{R}^q$ is differentiable on the open interval $I \subset \mathbb{R}$ and that $|g(t)| = 1$ for all $t \in I$. Then the vector $g(t) \in \mathbb{R}^q$ is perpendicular to the vector $Dg(t) \in \mathbb{R}^q$ for all $t \in I$.

TRUE
 $1 = |g(t)|^2 = g(t) \cdot g(t)$. Differentiate wrt t :
 $0 = Dg(t) \cdot g(t) + g(t) \cdot Dg(t) \Rightarrow g(t) \cdot Dg(t) = 0$.

(c) For a harmonic function $h: \mathbb{R}^2 \rightarrow \mathbb{R}$, if h has a local minimum at the point $b \in \mathbb{R}^2$ then all second order partial derivatives of h vanish at b .

TRUE
At b , $\partial_{11}h(b)$ & $\partial_{22}h(b) \geq 0$. Then both are 0 since h is harmonic. Also $\Delta h(b) = (\partial_{11} + \partial_{22} - \partial_{12}\partial_{21})h(b) \geq 0$.
Because $\partial_{12}h(b) = \partial_{21}h(b)$, we must have both 0.
